AS 1103.4—1992

Australian Standard®

**Diagrams, charts and tables for
electrotechnology**

**Part 4: Guiding principles for the
preparation of circuit diagrams**

This Australian Standard was prepared by Committee TE/13, Symbols, Units and Quantities for Electrotechnology. It was approved on behalf of the Council of Standards Australia on 26 February 1992 and published on 15 May 1992.

The following interests are represented on Committee TE/13:

- The Association of Consulting Engineers, Australia
- Civil Aviation Authority
- Confederation of Australian Industry
- Department of Defence
- Department of Technical and Further Education, N.S.W.
- Department of Technical and Further Education, S.A.
- Electricity Supply Association of Australia
- Institute of Draftsmen, Australia
- Institution of Radio and Electronics Engineers, Australia
- Queensland Chamber of Mines
- Railways of Australia Committee
- Royal Melbourne Institute of Technology
- State Training Board of Victoria

Review of Australian Standards. To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

AS 1103.4—1992

Australian Standard®

**Diagrams, charts and tables for
electrotechnology**

**Part 4: Guiding principles for the
preparation of circuit diagrams**

First published as AS 1103.4—1978.
Second edition 1992.

PREFACE

This Standard was prepared by the Standards Australia Committee on Symbols, Units and Quantities for Electrotechnology to supersede AS 1103.4—1978. It is one part of the AS1103 series of Standards on *Diagrams, charts and tables for electrotechnology*.

This Standard is a comprehensive revision of the 1978 edition. The diagrams are revised to reflect the latest technology, including symbols which are aligned with AS 1102 series (*Graphical symbols for electrotechnology*).

The purpose of this Part is to give guidance on principles to be used in the preparation of circuit diagrams for the electrical, electronics and similar electrotechnology fields. In this regard it is an extension of AS 1103, Part 3: *General rules for the preparation of diagrams and associated documents*. Part 4 demonstrates that a circuit diagram should show, by means of graphical symbols, the electrical connections and functions of a specific piece of equipment without regard to the physical size, shape or location of the parts. Numerous examples are given to demonstrate the variety of methods which may be used to illustrate the basic principles set out in Part 3 and, without going into unnecessary detail, to demonstrate the simplifications which are considered permissible in achieving the main aim.

In its terminology, format and general treatment of the subject, this Part is consistent with the recommendation of IEC 113-4 (1975), *Diagrams, charts, tables, Part 4: Recommendations for the preparation of circuit diagrams*. In the main, it is technically identical with IEC 113-4 but some diagrams have been replaced by others having more meaning in the Australian context.

Attention is drawn to the clause references, enclosed in parentheses, below the diagrams. These are references to the relevant text to provide a fuller understanding of the example and for ease of use of the Standard.

The AS 1103 series of Standards is complementary to the AS 1100 series (*Technical Drawing*) and to the AS 1102 series (*Graphical symbols for electrotechnology*). For information on matters specific to drawing practice which are not covered in the AS 1103 series, reference should be made to the AS 1100 series. In addition, reference may also be required to AS 1046, *Letter symbols for use in electrotechnology*, Part 1: *General*, and Part 2: *Telecommunications and electronics*.

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

STANDARDS AUSTRALIA

Australian Standard

Diagrams, charts and tables for electrotechnology

Part 4: Guiding principles for the preparation of circuit diagrams

1 SCOPE This Part of the Standard specifies guiding principles to assist in the preparation of circuit diagrams for electrical and electronic fields of use.

1.2 REFERENCED DOCUMENTS The following documents are referred to in this Standard:

AS

- 1102 Graphical symbols for electrotechnology
- 1102.102 Part 102: Symbol elements, qualifying symbols and other symbols having general application
- 1102.103 Part 103: Conductors and connecting devices
- 1103 Diagrams, charts and tables for electrotechnology
- 1103.1 Part 1: Definitions and classifications
- 1103.3 Part 3: General rules for the preparation of diagrams and associated documents
- 1359 Rotating electrical machines—General requirements
- 1359.3 Part 3: Direction of rotation and marking of terminals
- 3702 Item designation in electrotechnology

BS

- 822 Terminal markings for electrical machinery and apparatus
- 822.6 Part 6: Terminal markings for rotating electrical machinery

2 PURPOSE AND CONTENT OF A CIRCUIT DIAGRAM

2.1 Purpose A circuit diagram should—

- (a) explain the functioning of the equipment or part of it, if necessary, with the aid of a description or supplementary information, e.g. charts and tables;
- (b) provide data for the preparation of wiring diagrams or tables (in conjunction with constructional design information when necessary); and
- (c) facilitate testing and fault location.

Additional written instructions, wiring and location diagrams and tables may be required for a full understanding of the equipment.

2.2 Content A circuit diagram should show, by means of graphical symbols, the electrical connections and functions of a specific circuit arrangement without regard to the physical size, shape, or location of the parts. The diagram facilitates the tracing of the circuit and its functions.

Simplifications are permissible in the following cases:

- (a) Single-line representation of the whole circuit or part of it may be used, if it is sufficient for the defined purpose.
- (b) Part of the circuit diagram may be replaced by block symbols or rectangles to save space or to improve clarity. In such cases, reference should be made to the complete diagram.
- (c) When a particular circuit arrangement is repeated, it may be sufficient to show this circuit arrangement once only in detail with appropriate references to the detailed diagram replacing the other circuits.
- (d) If external or common circuits are necessary to understand the circuits concerned, they may be shown in simplified form with a reference to the relevant complete diagram.

3 GENERAL GUIDING PRINCIPLES

3.1 Layout The most important consideration in the preparation of a circuit diagram is the adoption of a clear layout which will best aid understanding and fulfil the purposes outlined in Clause 2.

3.2 Lines Lines representing conductors on a diagram should be straight with a minimum of cross-overs and changes of direction. However, these considerations should not dominate. Individual circuits should preferably be arranged vertically as shown in Figure 1 or horizontally as shown in Figure 2.
